Introduction

What is computer experiments?
Introduction

What is computer experiments?

- Many physical experiments which cannot be implemented practically could only be studied by complex computer codes.
- The output of a computer simulator relating $x$ and $y(x)$ can be viewed as a black-box process

$$x \rightarrow \text{Simulators} \rightarrow y(x)$$
Introduction

What is computer experiments?

- Many physical experiments which cannot be implemented practically could only be studied by complex computer codes.
  - The output of a computer simulator relating $x$ and $y(x)$ can be viewed as a black-box process

  $$\ x \rightarrow \text{Simulators} \rightarrow y(x)$$

Is computer experiments popular?

- Personal opinion: computer experiments is not super popular in this big data generation but have become increasingly popular in the past two decades.
- References: Santner et al. (2003), and Jones and Johnson (2009)
Industrial Application

- The Langley glideback booster (Gramacy and Lee, 2008)

Figure 1: The glideback booster (NASA, Pamadi et al. 2014)

- The booster is being developed through the computer simulators.
- The primary goal is to model the lift force as a function of speed, the angle of attack, and the sideslip angle.
Environmental Application

- Dynamics of Ice Sheets and Glaciers (Greve 2004)

Figure 2: Ice Sheet Geometry (Course Note, Matthew Pratola 2013)
Biomechanical Application

- A finite element (FE) computational simulator of the dynamic tibial contact stress in gait (Leatherman et al. 2014)

![Figure 3: 3D FE simulator (HSS, Guo 2014)]

- 60 points from the FE simulator
- 50 kinds of material properties
- Consider 10,000 different population properties in each kind of material properties
- Find the best material design!
Injection Molding Example

Joint work with Jose Castro, Rachmat Mulyana, Maria Villarreal-Marroquin, Thomas Santner, and Angela Dean
Factors of Injection Molding

A computer simulator

- 7 factors: Melting time, Packing time, Packing pressure, Cooling time, Heat transfer coefficient (HTC) flow, HTC pack, and HTC open
- 35 simulator data
- Some interested outputs: Length, Thickness, and Volume.

How to select design points?

- Physical experiments
  - George Box: Block what you can, randomize what you cannot
  - Reduce the variance: Suppose we want to fit a simple regression and we know the range of independent variable is [0, 1]. Which design will you pick?

Hint: $\text{Var}(\hat{\beta}) = (X^T X)^{-1} \sigma^2$
The code is deterministic: No random error.
Designs should not take more than one observation at any set of inputs (no replication)
Design of Computer Experiments

- **The code is deterministic**: No random error.
  - Designs should not take more than one observation at any set of inputs (no replication)

- **All input factors are known**: No need for randomization and blocking.
  - Designs should provide information about all portions of the experimental region (*space filling*)
Design of Computer Experiments

- The code is deterministic: No random error.
  - Designs should not take more than one observation at any set of inputs (no replication)

- All input factors are known: No need for randomization and blocking.
  - Designs should provide information about all portions of the experimental region (space filling)

- Suppose we want to select design points for a computer experiment. Which design will you pick?
Latin Hypercube Design

McKay et al. (1979) introduced the Latin Hypercube Design (LHD) which is the foundation of almost all design issues in computer experiments.

- Experimental region is the unit square $[0, 1]^2$ and a design consists of 4 points: Divide each axis $[0, 1]$ into the 4 equally spaced interval.
- An arrangement in which each integer appears exactly once in each row and in each column.
- Select a point at random.
Maximin LHD

Not all LHDs are good!

Morris and Mitchell (1995) proposed to find the best LHD by maximizing the minimum distance between the points.

Models for Computer Experiments

- Computer simulators: **Time-consuming**
  - Use the statistical model as a surrogate for the computer simulator

\[ y(x) \text{ as a realization of the random function} \]
\[ Y(x) = F(x) \beta + Z(x) \]

where \( \beta \) is the unknown constant vector (regression parameter), the \( F \) is a known regression function, and \( Z(x) \) is a mean zero, second-order stationary Gaussian process, and

\[ \text{Cov}(Y(x_1), Y(x_2)) = \sigma^2 R(x_1 - x_2) \]

Notice that if \( Z(x) \) was replaced by independent random errors, this would be the standard general linear model. However, we have allowed observations to be correlated.
Models for Computer Experiments

- Computer simulators: **Time-consuming**
  - Use the statistical model as a surrogate for the computer simulator

- Gaussian Process (GP) Model (Kriging)

  View $y(x)$ as a realization of the random function

  $$Y(x) = F(x)^T \beta + Z(x),$$

  where $\beta$ is the unknown constant vector (regression parameter), the $F$ is a known regression function, and $Z(x)$ is a mean zero, second-order stationary Gaussian process, and

  $$\text{Cov}(Y(x_2), Y(x_2)) = \sigma^2 R(x_1 - x_2)$$

- Notice that if $Z(x)$ was replaced by independent random errors, this would be the standard general linear model. However, we have allowed observations to be correlated.
Predictor

- Empirical best linear unbiased predictor (EBLUP)

\[
\hat{y}(x_0) = f^T(x_0)\hat{\beta} + r_0^T\hat{R}^{-1}(Y - F\hat{\beta}),
\]
Prediction of Injection Molding

Here we randomly took 30 points as training data of the injection molding example and tried to predict the remaining 5 points using GP model.

Sensitivity Analysis

- One property of computer experiment is a large number of input variables.
- Sensitivity analysis tries to determine how variable the output is to change in the inputs.
- The most popular sensitivity analysis is based on an ANOVA-type Decompositions (Sobol’, 1990).
SA based on ANOVA Decomposition

- Overall mean: \( y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) \, dx_1 \cdots dx_d \)
SA based on ANOVA Decomposition

- Overall mean: \( y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) \, dx_1 \cdots dx_d \)
- Main effect: \( y_i(x_i) = \int_{0}^{1} \cdots \int_{0}^{1} y(x_1, \ldots, x_d) \, dx_{-i} - y_0 \)
SA based on ANOVA Decomposition

- Overall mean: \( y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) \, dx_1 \cdots dx_d \)
- Main effect: \( y_i(x_i) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-i} - y_0 \)
- Interaction effect:
  \[
  y_{i,j}(x_i, x_j) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-ij} - y_0 - y_i(x_i) - y_j(x_j)
  \]
SA based on ANOVA Decomposition

- Overall mean: \( y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) dx_1 \cdots dx_d \)
- Main effect: \( y_i(x_i) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) dx_{-i} - y_0 \)
- Interaction effect:
  \( y_{i,j}(x_i, x_j) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) dx_{-ij} - y_0 - y_i(x_i) - y_j(x_j) \)
- Total variance \( V = \int_{[0,1]^d} y^2(x_1, \ldots, x_d) dx_1 \cdots dx_d - y_0^2 \)
SA based on ANOVA Decomposition

- **Overall mean:** \( y_0 = \int_{0}^{1} y(x_1, \ldots, x_d) dx_1 \cdots dx_d \)

- **Main effect:** \( y_i(x_i) = \int_{0}^{1} \cdots \int_{0}^{1} y(x_1, \ldots, x_d) dx_{-i} - y_0 \)

- **Interaction effect:** 
  \( y_{i,j}(x_i, x_j) = \int_{0}^{1} \cdots \int_{0}^{1} y(x_1, \ldots, x_d) dx_{-ij} - y_0 - y_i(x_i) - y_j(x_j) \)

- **Total variance** 
  \( V = \int_{0,1}^d y^2(x_1, \ldots, x_d) dx_1 \cdots dx_d - y_0^2 \)

- **Partial variance** 
  \( V_{i_1, \ldots, i_s} = \int_{0}^{1} \cdots \int_{0}^{1} y_{i_1, \ldots, i_s}^2(x_{i_1}, \ldots, x_{i_s}) dx_{i_1} \cdots dx_{i_s} \)
SA based on ANOVA Decomposition

- **Overall mean:** 
  \[ y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) \, dx_1 \cdots dx_d \]

- **Main effect:** 
  \[ y_i(x_i) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-i} - y_0 \]

- **Interaction effect:** 
  \[ y_{i,j}(x_i, x_j) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-ij} - y_0 - y_i(x_i) - y_j(x_j) \]

- **Total variance** 
  \[ V = \int_{[0,1]^d} y^2(x_1, \ldots, x_d) \, dx_1 \cdots dx_d - y_0^2 \]

- **Partial variance** 
  \[ V_{i_1, \ldots, i_s} = \int_0^1 \cdots \int_0^1 y_{i_1, \ldots, i_s}^2(x_{i_1}, \ldots, x_{i_s}) \, dx_{i_1} \cdots dx_{i_s} \]

- **First-order sensitivity index (Main effect index):** 
  \[ S_i = V_i / V \]
SA based on ANOVA Decomposition

- Overall mean: \( y_0 = \int_{[0,1]^d} y(x_1, \ldots, x_d) \, dx_1 \cdots dx_d \)
- Main effect: \( y_i(x_i) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-i} - y_0 \)
- Interaction effect:
  \[ y_{i,j}(x_i, x_j) = \int_0^1 \cdots \int_0^1 y(x_1, \ldots, x_d) \, dx_{-ij} - y_0 - y_i(x_i) - y_j(x_j) \]
- Total variance \( V = \int_{[0,1]^d} y^2(x_1, \ldots, x_d) \, dx_1 \cdots dx_d - y_0^2 \)
- Partial variance \( V_{i_1,\ldots,i_s} = \int_0^1 \cdots \int_0^1 y_{i_1,\ldots,i_s}^2(x_{i_1}, \ldots, x_{i_s}) \, dx_{i_1} \cdots dx_{i_s} \)
- First-order sensitivity index (Main effect index): \( S_i = V_i / V \)
- Total sensitivity index (Total effect index):
  \[ T_i = S_i + \sum_{j > i} S_{ij} + \sum_{j < i} S_{ji} + \cdots S_{1,2,\ldots,d} \]

Calibration

- Does the computer model adequately represent reality?
Calibration

- Does the computer model adequately represent reality?
- 19 physical observations of the Injection Molding example

![Graph showing calibration data]
Calibration Parameters

- 4 factors in physical experiments:
  - Melting time, Packing time, Packing pressure, Cooling time

- 7 factors in computer experiments:
  - Melting time, Packing time, Packing pressure, Cooling time, HTC flow, HTC pack, and HTC open

- Calibration parameters:
  - Calibration parameters are those input variables which can be used to run computer simulators but are unknown in physical experiments.
  - HTC flow, HTC pack, and HTC open
Bayesian Calibration of Computer Experiments

Physical system observations $y_p^\ell$ can be modeled as

$$Y_p^\ell(x) = \mu_\ell(x) + \epsilon_\ell(x), \quad \ell = 1, \ldots, m,$$

where

1. $\mu_\ell(\cdot)$ is equal to the mean of a physical system.
Bayesian Calibration of Computer Experiments

- Physical system observations $y^P_\ell$ can be modeled as
  \[ Y^P_\ell(x) = \mu_\ell(x) + \epsilon_\ell(x), \quad \ell = 1, \ldots, m, \]  
  where
  1. $\mu_\ell(\cdot)$ is equal to the mean of a physical system.

- When $y^s_\ell(x, t)$ is the data from a deterministic computer simulator, Kennedy and O’Hagan (2001) introduced
  \[ \delta_\ell(x) \equiv \mu_\ell(x) - y^s_\ell(x, \phi). \]  
  1. $\phi$ is the true value of calibration parameters,
  2. We model $\delta_\ell(\cdot)$ and $y^s_\ell(\cdot)$ as realizations of Gaussian processes $U_\ell(\cdot)$ and $Y^s_\ell(\cdot)$, so
  \[ U_\ell(x) = [Y^s_\ell(x, \hat{\phi})|y^P_\ell, y^s_\ell] + [\Delta_\ell(x)|y^P_\ell, y^s_\ell], \]  
  3. $\delta_\ell(\cdot)$ is unidentifiable from frequentist viewpoint,
  4. models $\delta_\ell(\cdot)$ based on Bayesian framework.
Calibrated Predictor

Using the calibrated predictor to predict 19 physical observations for output length
Thanks for your attention!
